

Cody Nguyen (Forked Repo: <https://github.com/Proxhi/472-2023-G3>)
Executive Summary

The scatter plot above looks at the repo of scottyab/rootbeer and we are strictly looking at commits for only source files. Matthew Rollings and Scott Alexander-Bown are seen to have the most contribution to the project. Matthew Rollings is seen editing most of the files around the middle time of when the project was started about 400 weeks ago. Scott Alexander-Bown was the first to start on most of the source files and is currently still updating the files. These two individuals have proved to be crucial to the project's development. We only see one contribution from Slim Namouchi, Fi5t, Ali Waseem, Leon Karabchevsky, BIOCATCH, vyas, and leocadiotine. These users don't seem to necessarily need to be kept on the project, as they have only contributed to one source file with one commit. For this project, I have used various git commands, such as creating/switching branches and pushing to the remote branches. I have mainly used the source control in VS Code to stage my changes, commit, and push/pull.
